

KodetoCareer — Platform Idea Document

Version 1.0 | Confidential

1. The Problem We Are Solving

India produces over 1.5 million engineering graduates every year. Fewer than 40% of them are considered industry-ready on graduation day. The gap isn't a lack of intelligence — it's a structural failure in how technical education is delivered, tracked, and connected to employment.

The existing system has five critical failures:

Failure 1 — Fragmented Learning

Students learn from YouTube, Udemy, college lectures, and random PDFs all at once. There is no single system that organises their learning path, tracks their progress, and connects learning directly to placement outcomes. The result is confusion, incomplete skill development, and wasted time.

Failure 2 — Zero Placement Infrastructure

Most tier-2 and tier-3 colleges have a "placement cell" that is a single faculty member with a WhatsApp group. There is no system to track which student is placement-ready, no data on offer letters, no analytics on which skills lead to jobs. Colleges are flying blind.

Failure 3 — No Accountability in Training

Third-party training partners like KodetoCareer conduct batches across multiple colleges but have no standardised way to track attendance, assignment submission, quiz performance, or student progress in real time. Quality degrades with scale.

Failure 4 — Students Have No Ownership of Their Journey

Students receive no persistent record of their growth. Their certificates live in email inboxes. Their offer letters are paper documents. Their attendance records exist only in a register. Nothing is centralised, verifiable, or portable.

Failure 5 — Recruiters Cannot Discover Verified Talent

Recruiters who want to hire from tier-2 colleges have no efficient way to discover candidates, verify their skills, or assess placement readiness before investing in campus visits.

2. The Insight

Every successful ed-tech platform — Coursera, BYJU's, Unacademy — solves the learning side of the problem. None of them solve the placement infrastructure side. And none of them are built specifically for the training partner who sits between colleges and students.

KodetoCareer sits in a unique position: it already has relationships with colleges, students, and recruiters. What it lacks is the software infrastructure to turn those relationships into a scalable, data-driven business.

The insight is this: **the training partner is the most underserved actor in the education ecosystem**. They need a platform that does what Salesforce does for sales teams — gives them complete visibility, control, and automation across their entire operation.

3. The Solution

KodetoCareer Platform is a unified Training & Placement Management System that combines:

- A **Learning Management System (LMS)** for structured course delivery
- An **Enterprise Resource Planning (ERP)** layer for operations management
- A **Customer Relationship Management (CRM)** layer for student, college, and recruiter relationships
- A **Placement Engine** that tracks every student from enrollment to employment

It is built for three audiences simultaneously:

Audience | What They Get

Students | A single app for all learning, tests, certificates, and job preparation

Colleges | A dashboard showing student progress, attendance, skill levels, and placement data

KodetoCareer Team | A complete operations panel to manage every college, batch, trainer, and student

4. The Market Opportunity

Addressable Market:

- India has approximately 42,000 engineering and technical colleges
- Roughly 8,000 of these are tier-2 and tier-3 institutions with weak internal placement infrastructure
- Average batch size at a training partner engagement: 80–200 students

- Average revenue per student engagement: ■15,000–■40,000

Initial Beachhead:

- 20 colleges in the first year
- 3,000–5,000 active students
- Platform value: operations efficiency + data asset + recruiter network

Scale Scenario (Year 3):

- 200 partner colleges
- 50,000 active students
- Platform becomes a SaaS product licensed to other training partners nationally

Revenue Layers:

1. Training fees (existing revenue, now tracked on platform)
2. SaaS licensing to other training partners (■50,000–■2,00,000/year per partner)
3. Recruiter access and placement fees
4. Premium student subscriptions for advanced features

5. Why Now

Three forces have converged to make this the right moment:

AI is democratising development. A platform of this complexity would have taken 18–24 months and ■2–3 crore to build two years ago. With modern AI-assisted development tools, an MVP can be built in 60–90 days by a small team.

Colleges are demanding accountability. Post-COVID, college administrations are under pressure from parents, regulators, and ranking bodies to demonstrate placement outcomes. A partner who brings a data dashboard is now a competitive advantage.

Students expect consumer-grade software. Today's college students use Swiggy, CRED, and Instagram. They will not tolerate a WhatsApp group as a learning management system. Whoever gives them a proper app wins their trust.

6. Competitive Landscape

Platform | What They Do | Why They're Not the Same

Coursera / Udemy | Self-paced courses for individuals | No college operations layer, no placement engine

Google Classroom | Assignment and content delivery | No LMS, no analytics, no placement tools

Superset / Taggd | Campus recruitment platforms | Recruiter-side only, no learning management

Meritto (NoPaperForms) | College CRM for admissions | Admissions only, not training or placement

LearnApp / Unacademy | Consumer ed-tech | B2C, no college/trainer management layer

KodetoCareer is the only player building for the training partner in the middle.

7. The Unfair Advantage

KodetoCareer's moat is not the technology — it is the relationships. The company already has signed agreements with colleges, trust from students who have been placed, and a brand in its operating geography. The platform converts that relationship capital into a defensible data network.

Over time:

- More student data → better placement predictions
- More placement data → stronger recruiter relationships
- Stronger recruiter relationships → higher placement rates
- Higher placement rates → more college partnerships

This is a flywheel. Software starts it spinning.

8. Vision Statement

To become the operating system for career-focused technical education in India — the platform that every training partner, every college, and every aspiring tech professional uses to connect learning to employment.

9. Product Principles

1. Every screen must answer "what should I do next?"

The platform exists to guide action. For students: the next lesson. For admins: the student needing attention. For colleges: the report to share.

2. Data without action is noise.

Every metric displayed must be connected to something the user can do. Progress bars lead to lessons. Red flags lead to intervention tools.

3. Build for the trainer in Jaipur, not the developer in Bangalore.

The admin panel must work for a person who is not technical. Every workflow must be completable in under three clicks.

4. The student's data belongs to the student.

Certificates, offer letters, and performance records must be exportable and shareable by the student independently of the college or training partner.

5. Placement is the product. Learning is the process.

Every feature must be evaluated by asking: does this make it more likely a student gets a job?
